

IZYUROVA, G.I.
CA

Changes in the properties of water under the influence of hydrocarbon oils. A. I. Izyurova. *Vostochno-Zapadnaya Tekhn.* 13, No. 9, 18-20 (1967). Mineral oil: heavy, semirude (II), machine (III), cylinder (III) and petrolatum (IV) were placed in glass-stoppered flasks with aerated water, and inoculated with fecal sewage, 1 ml. l., at 20°. The consumption of O proceeded very rapidly, showing 2.70 for I, 1.51 for II, 0.2 for III, and 0.72 for IV, after two days; 15.08, 10.24, 7.94 and 2.88, resp., after ten days; and 12.74 for II, and 9.7 mg. ml. of oil for IV after twelve days. The consumption was greater for the lower grades, and where the oil was more finely subdivided. Simultaneously N was also consumed, an free CO₂ liberated, oxidizability increased, oxidation being practically complete in the case of I. There was also an increase in color. Evidently, an oil film may impart all these properties to the reserve water; and the effect may be even more pronounced than under asept. conditions. B. Gutoff.

Determination of biochemical requirements in oxygen in water sealed with liquid petrolatum. A. I. Iryutova. *Microbiology* (U. S. S. R.) 40, 242 (in English, 246) (1941); cf. C. A. 35, 6704, 7070. The use of liquid petrolatum for sealing, with the purpose of creating anaerobic conditions, is unreliable, especially in the case of strict anaerobes. Atm. O penetrates the oil at a greater rate when the water to be sealed is O-deficient. The oil itself is subject to biochem. oxidation at the expense of the underlying water. In 8 days, through an oil layer of 0.5-1.5 cm., the water absorbed atm. O₂ to 28-91% of satm.

Purification of water by electrolysis with aluminum electrodes. A. I. Izgurava and I. P. Ovchinkin. *Gigiena i Sanit.* 12, No. 3, 1-9(1947); cf. *C.A.* 40, 7458⁹. -Electrolysis with Al electrodes produces water suitable for drinking purposes, with considerable lowered bacterial count, which, however, still requires chlorination. The expenditure of elec. energy is rather high on the basis of lab. expts. but may be reduced by improved design of equipment. The expts. were conducted in a 17-l. glass vessel, at 6 v. and 0.35 amp. with spiral Al-wire electrodes placed horizontally near the bottom of the vessel. Both the color and the odor are substantially improved in a 1-hr. run on lake and run-off waters; N content is substantially unaffected; the amt. of dissolved O₂ drops by a factor of 5. Bicarbonates are largely destroyed and Ca and Mg are substantially removed by sepn. into the superficial film which forms during the process. Substantial decrease of total solids is observed (by removal into the above film). Ionic Al rises in the early stages, then drops, and is present only in traces after a 21-hr. standing after completion of electrolysis. G. M. Kosolapoff

ASB-55A METALLURGICAL LITERATURE CLASSIFICATION

CA

Purification of water by electrolysis with iron electrodes
A. L. Izuyrova and I. P. Ovchinnik. *Gigiena i Sanit.*
13, No. 7, 5-9 (1948). Water purification by electrolysis
with Fe electrodes is as satisfactory as that with Al elec-
trodes (L. and O., C.I. 43, 1507b) provided that filtra-
tion through sand is used, since Fe oxide coagulates
slowly. Water's contg. little dissolved O must be pre-
treated with a source of O; aeration can be employed or
must be electrolyzed with graphite or Sn electrodes.

/ Influence of petroleum products on development of lower aquatic plants. A. I. Iz'yumova (Ministry Health U.S.S.R., Moscow). *Gigiena i Sanit.* 1956, No. 10, 11-14. Small amts. of crude petroleum (up to 1 g. per l.) greatly accelerate the growth and development of lower aquatic plants as detl. in cultures (with sand and H₂O in suitably protected jars). When petroleum is introduced near the sand level, the effect is more pronounced than in the case with surface addn.

Title : Method of Production of Solid or Hollow Glass Fiber Drawn from
Semifree Meniscus.

Orig Pub: Polish patent 37690 of July 30, 1955.

Abstract: The molten glass mass flowing out from the bottom part of the
glass receiver through a funnel shaped mouthpiece is drawn into
fibers from the partly free surface of the meniscus, which guar-
antees the stability of the flow. Hollow fiber is produced by
the same method, but an opening is made in the center of the
mouthpiece, through which air is blown in. The produced glass
fiber differs profitably from fiber produced by drawing of rods
or by the centrifugal method by its uniform thickness.

Title : Nature of Internal Stresses in Glass.

Orig Pub: Szklo i ceram., 1955, 6, No 10, 229-231.

Abstract: The characteristic phenomenon of changing mechanical properties of glass fibers depending on their diameter, time and temperature are described and the attempts made so far to explain these anomalies are related. A new theory explaining the properties of thin glass fibers by relaxation effects is proposed, the applied method being based on thermodynamical considerations. The received results are substantiated by ocular demonstration of phenomena originating among atom groupations in the mass of glass. The paper is based mainly on the work of E. Daga and A. Ditzel (see RZhKhiz, 1956, 62269).

TITLE: Design and Calibration of a Test Hydrophone with a Lithium Sulfate Piezoelectric Element

PERIODICAL: Przegląd Telekomunikacyjny, 1960, No. 9, pp. 261 - 263

TEXT: The author briefly describes the design of a test hydrophone built in the Zakład Elektroakustyki Politechniki Warszawskiej (Department of Electroacoustics, Warsaw Polytechnic) and the conditions of calibration by means of reciprocity. A cross section of the hydrophone is shown in Figure 1. The reciprocity method of converter calibration, referred to as conventional practice, is applicable only if 1) the converters operate in the range of linearity and 2) the acoustic field in the range of converter calibration constitutes a free-wave field. The calibration of 2 converters by means of reciprocity consists of 3 field measurements and 4 electrical measurements. The accuracy of the tests depends on pool dimensions and varies as a function of frequency. In field tests, an accuracy of ± 0.5 dB may be assumed for frequencies above 8 kc, ± 1 dB between 6 and 8 kc, and ± 1.5 dB or worse below 6 dB. An accuracy of 0.5 dB may be assumed for electrical

AUTHORS: Jabłońska, J., Jablonski, K.

TITLE: A textolite ionization chamber for gamma-emitter activity measurements

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 7, abstract 8B42
("Rept. Inst. badań Jądrow. PAN", 1961, no. 255/XIII, 8 pp., illust.,
English; summaries in Polish and Russian)

TEXT: Design and features of a small (2 x 2 cm) ionization chamber with textolite walls (0.5 mm) are described in detail. The chamber together with a d-c amplifier is used for activity measurements on reactor-produced radioisotopes (e.g., Ir¹⁹², Co⁶⁰, and Au¹⁹⁸ with activities greater than 100 millicuries). Calibration results are given and the accuracy of measurements is estimated.

640. EVALUATION OF CHRONAXIE MEASUREMENTS IN SCLERODERMIA -
Auswertung von Chronaxiemessungen bei Sklerodermie - Jablonska S.,
Rubnow B. and Lukasiak B. Dermatol. Klin., Warschau - DERM.
WSCHR. 1957, 136/31 (821-837) Tables 14 illus. 3

Studies in 60 cases of circumscribed and diffuse sclerodermia revealed a prolongation of chronaxie, both in the foci of the disease and in the unaltered parts of the skin. This is a pathognomonic sign of sclerodermia, and can be used as a basis for differentiating it from other diseases. In all clinically doubtful cases, measurement of the sensory chronaxie is indicated. The prolongation of the conduction capacity of nerves in seemingly unaltered skin in sclerodermia appears to indicate a primary lesion of the nervous system. The fact that the chronaxie alterations in diffuse and in circumscribed sclerodermia are identical, suggests that these conditions are only morphological variants of one basic condition. The extent of the chronaxie alterations in foci of the disease, and especially in the unaltered skin, depends mainly on the activity of the disease. Evaluation of the chronaxie is of importance in determining the efficacy of treatment. A decreasing chronaxie means success, whereas persistently high values, even when accompanied by pro-

644. SCLERODERMA-LIKE CONDITIONS. THE DIFFERENTIAL DIAGNOSIS IN CONTRAST WITH SCLERODERMIA ON THE BASIS OF MEASUREMENTS OF CHRONAXIE SENSITIVITY - Sklerodermähnliche Zustände. Die Differenzialdiagnose gegenüber Sklerodermie auf Grund von Sensibilitätschronaxie-messungen - Jablonska S., Bubnow B. and Lukasiak B. Dermatol. Klin., Warschau - DERM. WSCHR. 1957, 136/45 (1201-1209) Illus. 12
With the aid of chronaxie sensitivity the authors were able to separate scleroder-mia from scleroderma-like changes. In sclerodermia the chronaxie is always lengthened even when the skin is seemingly unchanged.

839. DOES OCULAR PEMPFIGUS BELONG TO THE PEMPFIGUS GROUP?
Zagadnienie przynależności tzw. pęcherzycy ocznej do grupy pemphigus.
Jabłońska S., Segal P., Milewski B. and Dąbrowska H.
Klin. Dermatol. A. M., Warszawa - PRZEGL. DERM. WENER. 1958, 8/2
(135-147) Illus. 11

A case of so-called ocular pemphigus is compared with one of pemphigus vulgaris with primary mucosal lesions. The differential diagnosis is based on the histologi-cal findings (acantholysis in pemphigus vulgaris). The name 'pemphigoid mucosae' is proposed. The author rejects the name 'pemphigus ocularis', because the con-dition is not pemphigus, while there is not always conjunctival localization.

1151. CLASSIFICATION OF HAILEY-HAILEY'S PEMPHIGUS, ITS RELATIONSHIP WITH PEMPHIGUS VULGARIS AND THE VESICULAR VARIETY OF DARIER'S DISEASE - Zur Klassifikation des Pemphigus Hailey-Hailey. Seine Beziehung zum Pemphigus vulgaris und zur vesikulösen Variante des Morbus Darier - Jabłońska S. and Chorzeński T. Univ.-Hautklin., Warschau - DERMATOLOGICA (Basel) 1958, 117/1 (24-38) illus, 13

On the basis of 6 typical cases of Hailey-Hailey's pemphigus, and of a case of vesicular Darier's disease for comparison, the nosological position of Hailey-Hailey's pemphigus is discussed. The important morphological characteristic is acantholysis, while in Darier's disease the dyskeratotic formations of the 'corps ronds' and the 'grains' rank in the first place. Hailey-Hailey's pemphigus differs basically from bullous Darier's disease through the lack of the typical dyskeratosis. Hailey-Hailey's pemphigus can show a great similarity in the histological and cytological picture with pemphigus vulgaris, but a differential diagnosis is easily possible on the grounds of the clinical picture and the course of the disease. Hailey-Hailey's pemphigus is thus to be regarded as an independent nosological entity.
